

CONFERENCE MANAGER

Take Control of Your Meeting

Video conferencing and telepresence are great ways to connect with colleagues, customers, partners and vendors without the need for travel. For large-scale meetings with participants in multiple locations, it is often necessary to utilize a Multipoint Control Unit to manage the conference. For those that want the ability to manage their own multipoint calls, but don't want to invest in owning and managing their own MCU, we offer Conference Manager.

Conference Manager allows customers to control their own multipoint meetings by providing virtual control of a hosted MCU through the cloud. Customers can get all the advantages of having a dedicated MCU, without the upfront cost.

Conference Manager is a web-based tool that enables customers to take control of the scheduling and management of their video meetings. Scheduling, launching, managing, monitoring and reporting is consolidated into a simple, intuitive graphical user interface that allows users to:

- / Schedule video conferences — video endpoints, MCUs
- / Remotely manage upcoming video conferences
- / Monitor participants and sites connected to MCU
- / Independently verify the security of video conference sessions
- / Manage multiple conferences over multiple MCU environments from a single common interface
- / Receive reports on platform utilization statistics
